Goglio presents barrier compostable and recyclable solutions

Nowadays innovation trend is to get closer to simplicity and back to basics and nature adopting all the necessary rules to protect the world ecosystem.

Every industry sector follows this trend developing green solutions, especially the packaging sector which is working to replace multilayer not-recyclable materials with one-material or compostable laminates.

For years Goglio has devoted resources in Research and Development to widen the range of eco-friendly packaging products.

On the occasion of **All4Pack** (Paris, November 26-29, **Hall 6 Stand N060**) Goglio will present the latest barrier green solutions, both for coffee in capsules and for traditionally packed coffee.

The new generation **aluminum-free recyclable and compostable** materials, flagship of the Group's production, are endowed with the **exclusive water-based barrier lacquer** developed in Goglio, preserving the content at its best, while at the same time guaranteeing the same performances as the traditional barrier materials. Appealing and unique printing effects, as the paper or mirror effects, are also possible.

Furthermore Goglio will present the **Bio Valve, exclusive Goglio patent**, essential element for compostable packaging materials, and the revolutionary **compostable barrier capsule**, in addition to the traditional lids for capsules in aluminum with heat-sealing lacquer, printing and embossing finishings, and the latest eco-friendly high barrier plastic laminates.

Goglio staff will be available to show the complete offer of packaging solutions represented by fres-co system[®] trademark: a variety of materials, with aluminum, alu-free or compostable, vacuum, atmosphere, aseptic or hot fill packaging lines, the whole range of degassing valves, essential optionals to pack coffee in traditional formats or in capsules.

Come and visit Goglio booth in Paris Hall 6 Stand N060.
